## GENERAL SPECIFICATIONS

### Unit description

This new series of industrial chillers and heat pumps has been designed to meet the demands of global markets in the small-medium power industrial and commercial plants. Units are compact and highly configurable, built to fit different types of plants so to meet the needs of highly qualified engineers.

Units are water chillers and heat pumps condensed in air with axial fans suitable for outdoor installation: the structure and panels are robust, made of galvanized and painted steel; all fasteners are made of stainless steel or galvanized steel, the frame containing the electrical equipment and all the components exposed to weather have a minimum **IP54** degree of protection.

This series is composed of twelve models divided in four sizes with nominal cooling capacity from **53.5 to 200 kW** and thermal capacity from **57.5 to 214 kW**.

The units product cold water from 5 to 25°C (in summer) and hot water from 30 to 55°C (in winter) and **as standard** they are equipped with continuous adjustment of axial fans rotating speed in order to allow the units to operate both with low outdoor temperature in cooling mode and with high outdoor temperature in heating mode as well as to reduce noise emissions.

All the units are equipped with 2 scroll compressors arranged in pairs (tandem) on 1 circuit operating with **environmental friendly R410A gas**, brazed plate heat exchanger completely insulated and protected by water side with a differential pressure control and with an antifreeze electrical heater, coil heat exchanger made of louver aluminum fins and copper tubes, axial fans with profiled blades to contain noise and with thermal protection built-in, on-board electrical control panel equipped with control system to manage the main functions.

Hydronic group (MP) composed of fittings and connections is available as an accessory with 1 or 2 pumps and also with high available head pumps or with **Inverter** modulating pump; the accessory Water Storage Tank (SAA) is completely insulated and available on delivery side or for primary-secondary hydraulic circuit (Victaulic connections already in place) depending on the kind of plants to serve.

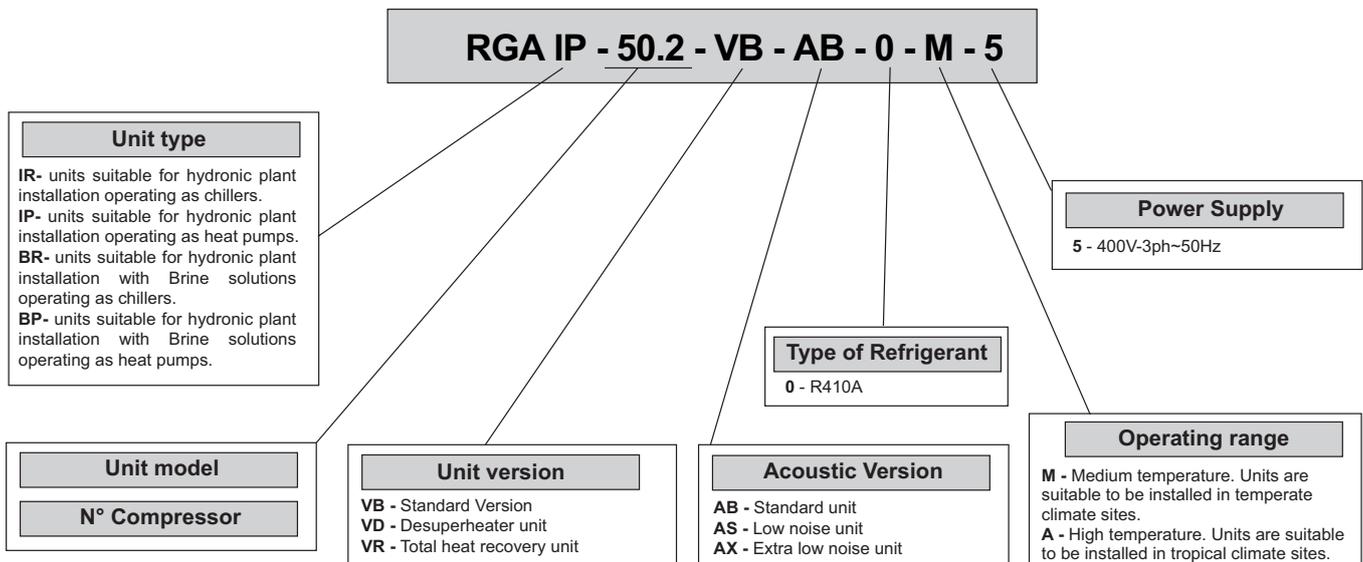

A variety of other accessories are available to extend the capabilities of the units.

During the design of the units particular attention has been given to achieve high system efficiency, to reduce overall energy consumptions and sound levels in order to meet the increasingly restrictive laws in terms of noise. Upon request, you can choose for a Standard Unit (AB) or Low noise unit (AS) which provides sound attenuation thanks to sound absorbing insulation in compressors area, sound jackets on compressors and reduced speed axial fans, or a Extra low noise unit (AX), which provides in addition slower axial fans and more powerful finned coils.

All units are accurately build in compliance with the existing standards and are individually tested in factory. Only electrical and hydraulic connections are required for installation.

### Identification code of the unit

The codes that identify the units are listed below and include the sequences of letters that determine the meanings for the various versions and set-ups.

The available special versions are described below:

**VB: Standard unit.**

**VD: Desuperheater unit (available for both IR units and IP units)**

Produces cold water in the same way as the standard version plus hot water **from 30 to 70°C** at the same time. This is achieved by installing a water-refrigerant gas heat exchanger between the compressor and coils in order to recover 15 to 20% of the heating capacity that would otherwise be dispersed in the air.

**VR: Total Heat Recovery unit**

Produces cold water as in the standard version plus hot water at a temperature of **35 to 50°C** at the same time. This is achieved thanks to a water-refrigerant gas heat exchanger that totally recovers the heating capacity that would otherwise be dispersed in the air. The total heat recovery function is enabled and disabled by means of a valve on the compressor delivery of each circuit: when the temperature of the water that enters the recuperator drops, the valve switches the hot gas flow from the condensing coils to the recovery heat exchanger. On the other hand, when the temperature of the water reaches the set-point, the valve shuts off the heat recuperator and switches the hot gas flow to the condensing coils.

## GENERAL SPECIFICATIONS

### Description of the components

The complete series of industrial chillers and heat pumps for use in hydronic systems includes **12 constructional sizes** ranging from **53.5 to 200 kW** in the cooling mode and **from 57.5 to 214 kW** in the heating mode.

#### Main components:

**1. Fans.** These are the helical type with scythe-shaped blades to increase the efficiency and reduce the noise level. The fans are directly coupled to the single-phase motor by means of an external rotor. Thermal protection against operating faults is installed inside the winding. As standard they are equipped with continuous adjustment of axial fans rotating speed in order to allow the units to operate both with low outdoor temperature in cooling mode and with high outdoor temperature in heating mode

**2. Electric control and monitoring panel.** This is housed in a metal casing in which the various electrical components are positioned on one metal plate.

#### 2a. The power section includes:

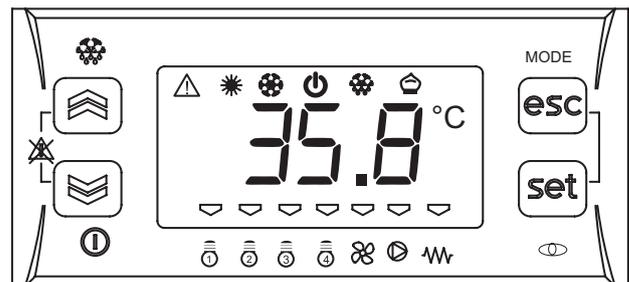

- Main door-locking circuit-breaker.
- Fuse-holder that can be isolated with protection fuse triad for each compressor.
- Fuse-holder that can be isolated with protection fuse for compressor oil heaters and antifreeze (if installed).
- Control contactor for each compressor.
- Protection fuse for the ventilation unit.
- Fan speed regulating board.
- Contactor and magnetothermic switch to protect the pump (if the Hydronic Kit accessory is installed).
- Pump contactor (if the Hydronic Kit accessory is installed).
- Phase presence and sequence monitoring device on power supply

#### 2b. The auxiliary section includes:

- Fuses on the auxiliary transformer.
- Fuses for fans protection
- Electromagnetic noise filter
- Adjusting fan speed board
- Insulating and safety transformer to power the auxiliary circuit.

#### 2c. The microprocessor monitoring section includes:

- User interfacing terminal with display.
- On-off key.
- Operating mode selector key.
- Compressor on-off display **LED**.
- Operational mode **LED**
- Antifreeze heaters activated indicator **LED**.
- Fans on-off display **LED**
- Pumps on-off display **LED**
- Check-control with fault code display
- Defrosting, alarm, economy, stand-by **LED**.
- ON / Stand-by remote - Summer/Winter (E/I) remote selection (IP unit only).

**Control system main functions:** temperature control of the water produced by the unit, compressor and pump operating hour counter, timing and cycling of start-ups, input parameters by keyboard, alarms management, smart defrosting control and operating mode change (only IP unit), dynamic set-point (climatic control), scheduling and integrative heaters control.

If you installed the hydronic kit these functions are enabled: antifreeze with pump, start-up cycle after prolonged inactivity (anti-sticking), if the hydronic kit installed has 2 pumps there is a cycling between each pump to ensure an equivalent lifetime, with inverter modulating hydronic kit the water flow of the plant can be adjusted.

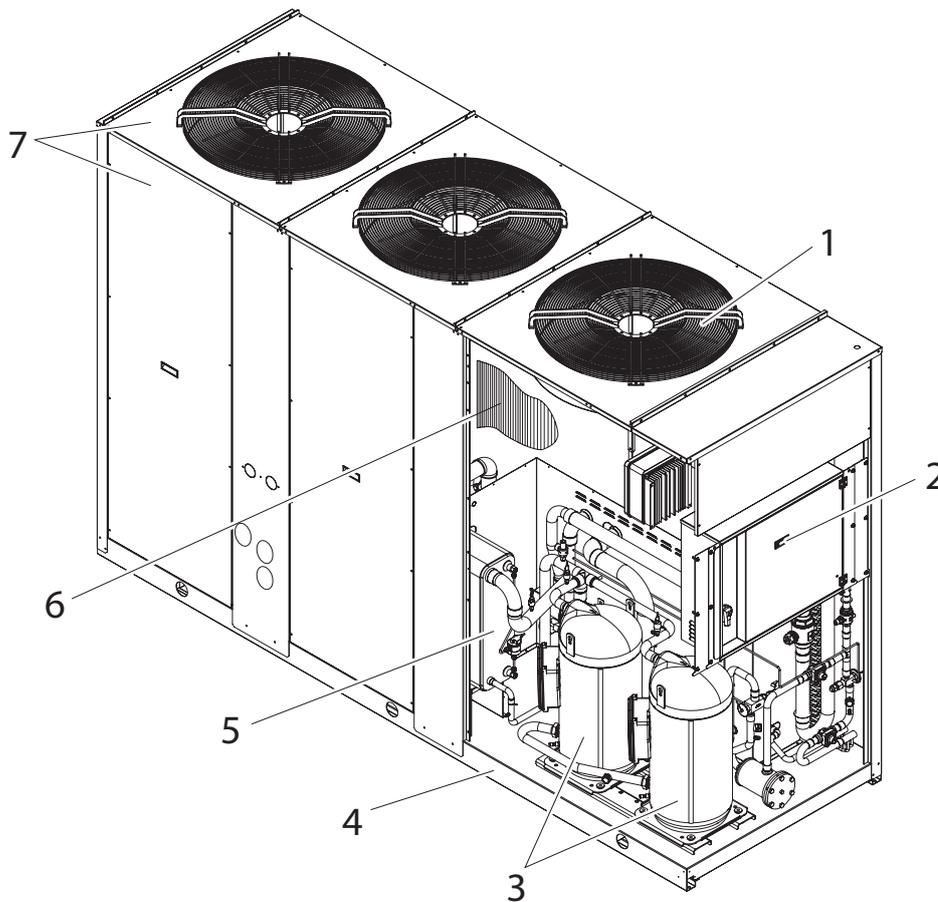

**Digital input functions:** low pressure, high pressure, high temperature on compressor supply, phase presence and sequence monitoring device on power supply, differential water pressure control, compressors thermal protection, fans thermal protection, pumps thermal protection (only if installed MP accessory), ON/OFF and remote operating mode change, demand limit and Economy function, recovery enabling (only for the **VR** Version), recovery Pump Thermal Protective (only for the **VR** Version), recovery differential water pressure control (only for the **VR** Version).

**Digital output functions:** compressor start-up, pump start-up (only with MP accessory), plate heat exchanger electrical heater, remote general alarm, 4-way valve (only IP unit), integrative heaters and clean contact on compressors start-up, recovery valve management (only for the **VR** Version), recovery pump management (only for the **VR** Version).

**Analogic input functions:** in and out water temperature, coil temperature probe, external air temperature probe (if present), in and out recovery water temperature (only for the **VR** Version).

**Analogic output functions:** continuous adjustment of axial fans rotating speed, continuous adjustment of pump rotating speed.

## GENERAL SPECIFICATIONS

**3. Compressors.** They are the **SCROLL** type with orbiting coil equipped with built-in thermal protection and oil heater. The AS unit includes: a soundproofing jacket for the compressors, an acoustic cladding around the compartment where they are housed, to reduce noise level, and reduced rotating speed of axial fans; AX unit integrates batteries with condensing surface increased and rotating speed of axial fans further reduced. All units are equipped with two compressors connected in parallel (1 single cooling circuit) which can operate at the same time (**100% cooling power**) or individually (**50% of the cooling power**), thus adapting to the different thermal loads of the system supplied.

**4. Frame structure** made of galvanized sheet metal panels coated with polyurethane powder paint to ensure maximum protection against adverse weather conditions.

**5. Evaporator** made of brazed stainless steel plates (**AISI 316**). It is installed in a shell of heat-insulating material to prevent the formation of condensation and heat exchanges towards the outside. Standard supply also includes antifreeze heater a differential pressure switch on the water circuit to avoid the risk of freezing if the water flow is shut off for some reason.

**6. Condensing coils,** the aluminium finned pack type with shaped profile to increase the heat exchange coefficient and with copper pipes arranged in staggered rows. A sub-cooling section is integrated into the lower part.

**7. Covering panels,** made of galvanized sheet metal coated with polyurethane powder paint to ensure maximum protection against adverse weather conditions

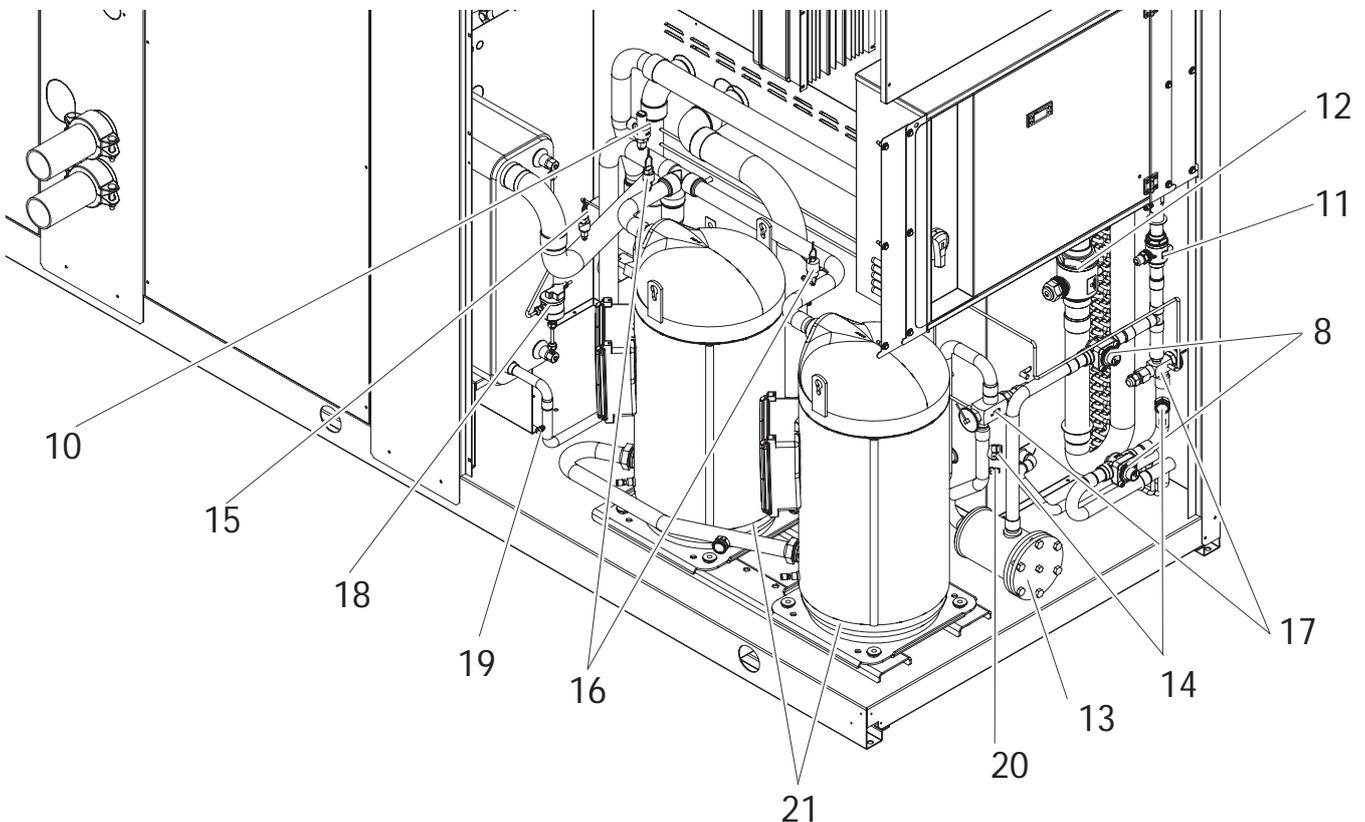

**8. One-way valves (IP unit only),** allowing the coolant to pass into the appropriate exchangers, depending on the operating cycle.

**9. 4-way cycle reversal valve (IP unit only),** reverses the flow direction of the coolant as the summer/winter operating mode is changed.

## GENERAL SPECIFICATIONS

### Hydraulic and cooling circuit components

- 10. Safety valve.** Installed on the delivery pipe of the compressors, this operates if extreme faults should occur in the plant.
- 11. Fluid cock.** Ball type, this allows the gas flow on the fluid line to be turned on and off. Along with the cock on the compressor delivery, it allows the components of the fluid line to be subjected to extraordinary maintenance work and the compressors to be replaced if necessary (without discharging the coolant from the unit).
- 12. Compressor delivery cock.** Ball type, allows the gas delivered to the compressors to be turned on and off.
- 13. Dehydrator filter.** Mechanical type. Retains impurities and traces of moisture in the circuit. **Hermetic** type for models **50÷80**; **cartridge** type for models **90÷200**.
- 14. Fluid and humidity indicator.** Signals when fluid passes through the circuit, indicating that the coolant charge is correct. The fluid indicator light also indicates the amount of moisture in the coolant by changing colour.
- 15. Low pressure switch (N°1 of series IR version, N°2 of series IP version).** With fixed setting. It is installed on the suction pipe and blocks the compressors if the operating pressures drop below the tolerated values. Automatically resets as the pressure increases. If it activates frequently, the unit will block and can only be restarted by resetting via the user interface terminal.
- 16. High pressure switch (n°2).** With fixed setting. Are is installed on the delivery pipe and blocks the compressors if the operating pressures exceed the tolerated values. If it activates, the unit will block and can only be restarted by resetting via the user interface terminal.
- 17. Thermostatic valve.** With external equalizer, this supplies the evaporator correctly, keeping the selected overheating degree at a steady level.
- 18. Water differential pressure switch.** This is standard supply and is installed on the connections between the water inlet and outlet of the exchanger. It stops the unit if it activates.
- 19. Pressure taps: 1/4 " SAE (7/16" UNF) type with flow regulator.** Allow the operating pressure of the system to be measured: compressor delivery, lamination component inlet, compressor intake.
- 20. Pressure taps: 5/16 " SAE type with flow regulator.** Allow the charge/discharge of the gas from the system, precisely from compressor outlet an expansion valve inlet.
- 21. Electrical heating elements to heat the compressor oil.** "Belt" type. These activate when the compressor turns off and keep the temperature of the oil sufficiently high so as to prevent coolant from migrating during these pauses.
- Fluid receiver (IP unit only),** this is a plenum tank that accounts for variations to the coolant charge the machine must supply as the summer/winter operating mode varies.
- Fluid separator (IP unit only),** on the compressor intake to protect against possible fluid back-flows.

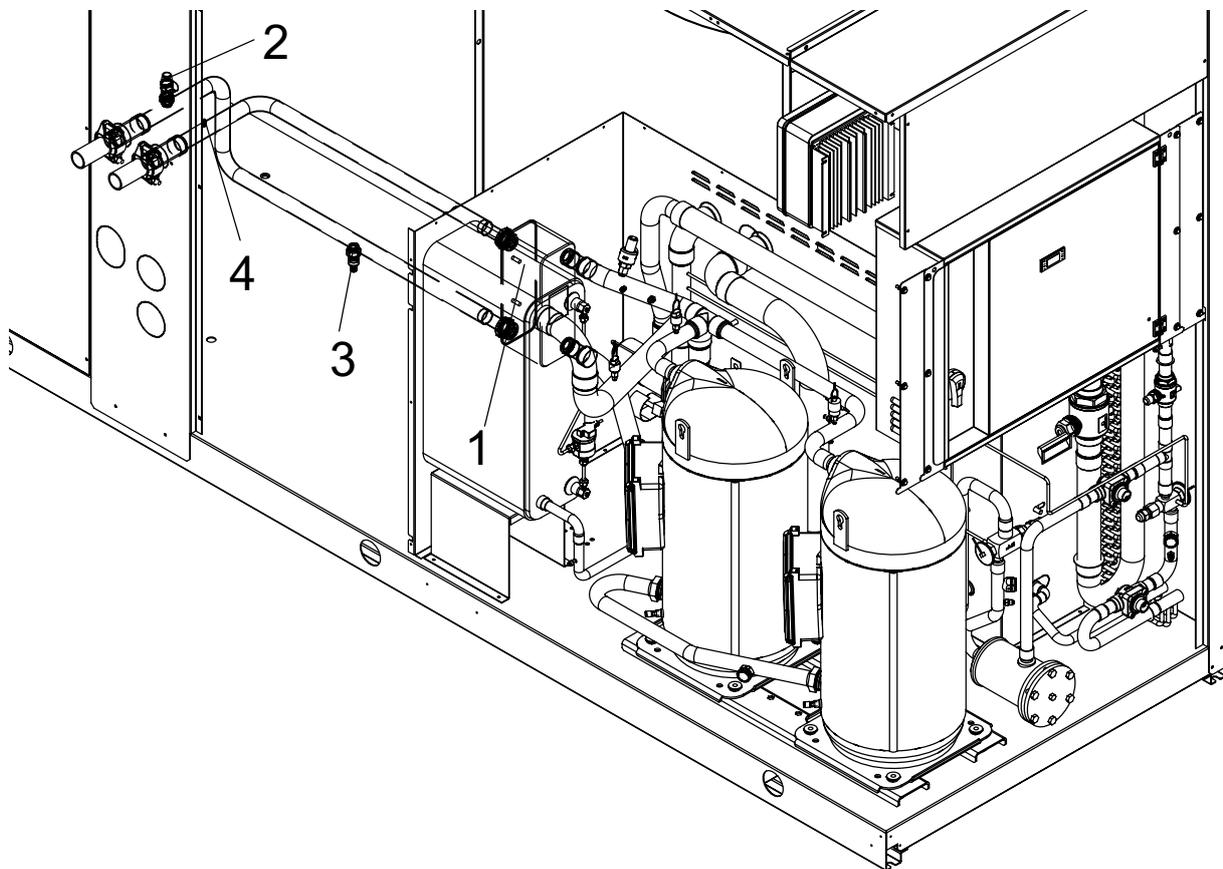

## GENERAL SPECIFICATIONS

### Desuperheater unit VD (available for both IR units and IP units)

#### Hydraulic and chilling circuit components:

- 1. Desuperheater.** Specially designed for the specific version. Plate type, made of stainless steel (AISI 316). It is installed within a shell of thermal barrier insulating material to prevent heat exchanges towards the outside. Standard supply also includes an electric antifreeze heater to prevent the parts from freezing during the winter, when the system remains at a standstill (if not drained).
- 2. Water safety valve.** On the heat recovery inlet pipe. It acts whenever faulty service leads to an operating pressure in the plumbing system that exceeds the valve opening value (Fig.1).
- 3. Water drain cock** for emptying the exchangers and pipes of the machine dedicated to heat recovery (Fig. 1).
- 4. Air vent.** Accessed by removing the front panels. It consists of a manually operated valve installed in the highest part of the water pipes. To use in conjunction with the water drain cocks situated in the rear part of the unit, for emptying the exchangers and pipes dedicated to heat recovery.

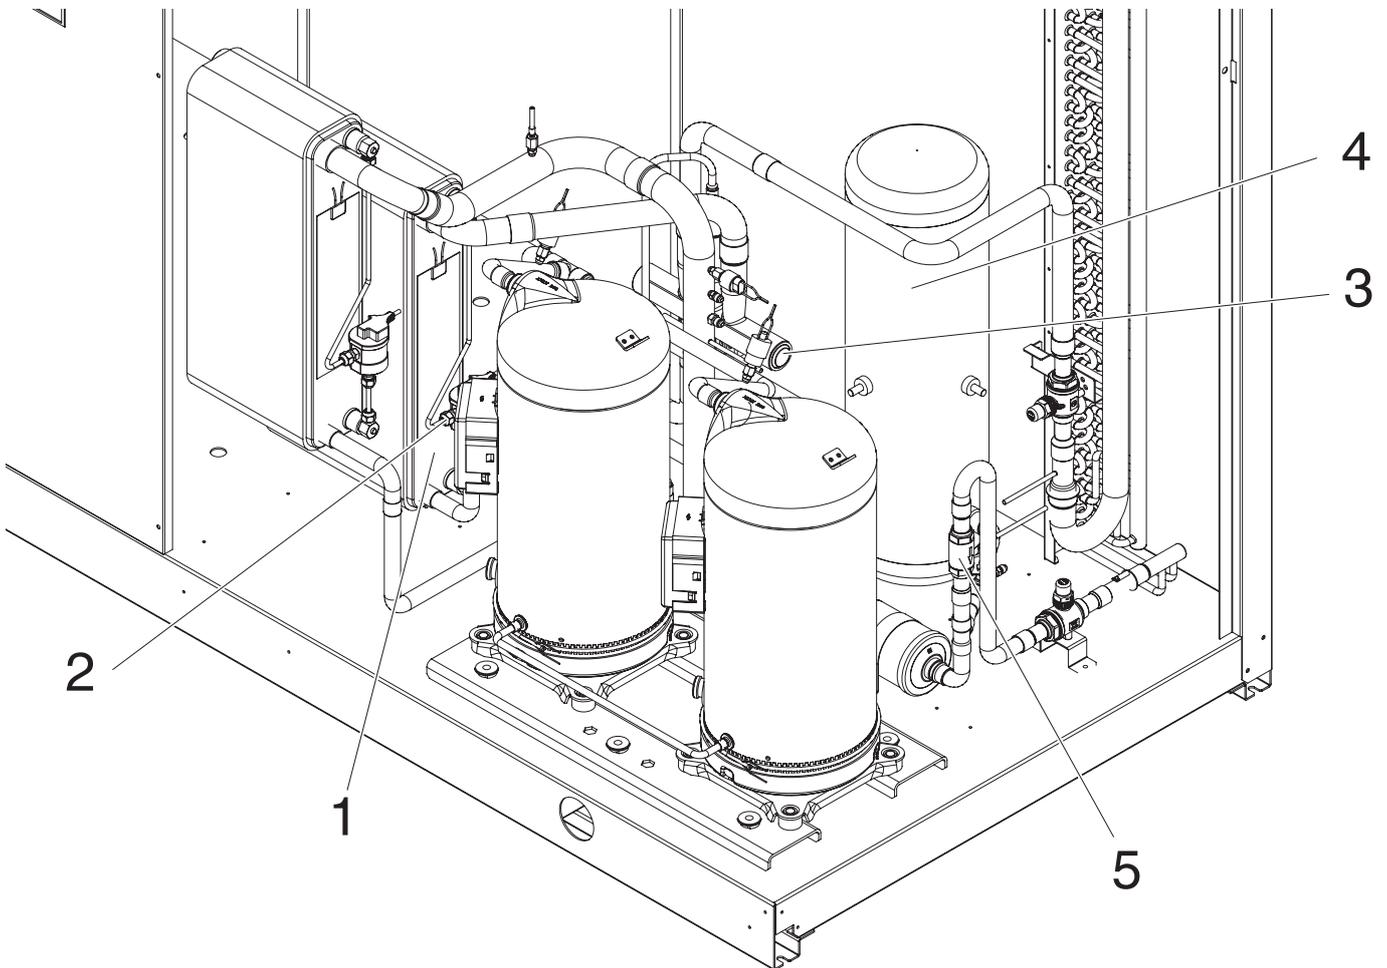

## GENERAL SPECIFICATIONS

### Total Heat Recovery unit VR (only available for IR units)

#### Hydraulic and cooling circuit components:

- 1. Heat recovery exchanger.** Specially designed for the specific version. Plate type, made of stainless steel (AISI 316). It is installed within a shell of thermal barrier insulating material to prevent heat dispersion towards the outside. Standard supply also includes an electric antifreeze heater to prevent the parts from freezing during the winter, if it is not drained.
- 2. Differential water pressure switch.** Installed on exchanger. It disables the heat recovery version if activated owing to lack of water flowing through the recovery exchangers.
- 3. Heat recovery management valve.** This delivers refrigerant to the condensing coils or heat recovery exchanger, depending on demands for hot water, and into the appropriate exchangers depending on whether hot water is required or not.
- 4. Fluid receiver.** This is a plenum tank that accounts for the refrigerant charge variations required by the machine as the operating modes change (condensing in air or in water).
- 5. One-way valves.** Make the refrigerant obligatorily pass through the appropriate heat exchangers (coils / heat exchanger), depending on the operating mode.

## ACCESSORIES AND OPTIONAL EQUIPMENT

### Accessories

**AVG - Rubber vibration dampers.** Consisting of 4/6 rubber vibration dampers to fit under the unit. Reduce the extent to which the mechanical vibrations created by the compressors and fans during normal operation are transmitted to the bearing surface of the machine. The insulating degree of the vibration dampers is about 85%.

**GM - Pressure gauge unit.** Consisting of 2 pressure gauges that display the pressure values of the refrigerating fluid on the compressor suction and delivery sides.

**GP - Protective grilles.** These are metal grilles installed to protect the finned banks.

**SAA - Water storage tank.** Made of adequately thick painted sheet metal, this reduces the number of compressor start-ups and fluctuations in the temperature of the water conveyed to the users. It is insulated with thermal barrier material to prevent the formation of condensation and heat exchanges towards the outside.

#### **Water storage tank. It consists of:**

**Water draining.** On-off action by means of a cock that can be accessed by removing the rear panel, positioned on the side of the unit opposite to the electric panel.

**Air vent.** Accessed by removing the rear panel positioned on the side of the unit opposite to the electric panel. It consists of a manually operated valve installed on the highest part of the wet pipes.

**Antifreeze heater connection.** 1"1/4 female threaded connection pre-engineered for installation of the antifreeze heater (RAG accessory).

**Water safety valve,** on the rear part of the tank. It acts whenever faulty service leads to an operating pressure in the hydraulic circuit that exceeds the valve opening value.

**BCN- Drain Pan Kit (M).** Provides a pan under the coil to drain the condensing water, fitted with 1/2" outlet connection positioned opposite to the electric control panel.

**KT** - the following kits are available (this accessory is mandatory if the Hydronic Kit is not installed).

- **Victaulic connection kit.** This accessory consists of steel pipes insulated with thermal barrier material and allows the water inlet/outlet to be connected straight inside the unit.

- **Complete pipe kit.** This accessory consists of steel pipes insulated with thermal barrier material and allows the water inlet/outlet connection to be routed to the machine.

- **Water storage tank pipe kit.** This accessory consists of steel pipes insulated with thermal barrier material and allows the water inlet/outlet connection to be routed to the machine.

#### **NB: YOU CAN CHOOSE ONLY ONE KIT.**

• **MP. Hydronic Kit (M).** Consists of:

**1 On-off ball valves.** Turn components such as the water filter, surge chamber and pump on and off when they require routine or extraordinary maintenance.

**2 Metal gauze water filter.** Can be turned on and off and inspected. It is installed on the pump delivery side. Prevents machining residues (dust, swarf, etc.) in the water pipes from entering the plate-type heat exchanger.

**3 Hydraulic pump.** Circulates water around the system. The pumps have a low/high head and suit the majority of installation requirements. The pumps are safeguarded by a magnetothermics installed in the chiller's electric panel.

**4 Surge chamber.** This is a closed, diaphragm type chamber. It absorbs the variations in the volumes of water in the system caused by temperature variations.

**5 Water filling.** Manual function with control positioned on the side of the unit opposite the electric panel and turned on and off by a cock that can be accessed by removing the rear panel.

**6 Water pressure gauge.** Connected to the water fill pipe. Displays the pressure of the water in the system.

**7 Water safety valve.**

**8 Water outlet.**

**9 Air vent.**

**10 Antifreeze heater connection** (RAG accessory).

## ACCESSORIES AND OPTIONAL EQUIPMENT

### MP. Hydronic Kit.

**MP : Hydronic Kit with 1 o 2 Pumps (The second pump, mounted in parallel to the first, allows to have a spare pump to be activated in case of failure of the first).** Besides the pumps, this accessory is equipped with all the hydraulic components (water filter, expansion tank, on-off valves, water pressure gauge, air vent, water outlet) required for complete installation and easy maintenance. **Different water accumulation tank configurations are therefore available in combination with the Hydronic Kit accessory:**

**MP1 / MP2 AM 2P STD: Accumulation on the Plant Delivery side (Standard)<sup>(A)</sup>:** The pump draws water from the system, sends it to the plate exchanger and from thence to the inertial accumulation tank. During normal operating conditions, the pump in this configuration is able to provide a residue head from 86 to 150 kPa (from 9 to 15 m.w.c.) for the circulating water.

**MP1 / MP2 AM 2P HP1: Accumulation on the Plant Delivery side (High)<sup>(B)</sup>:** The pump draws water from the system, sends it to the plate exchanger and from thence to the inertial accumulation tank. During normal operating conditions, the pump in this configuration is able to provide a residue head from 198 to 255 kPa (from 20 to 25 m.w.c.) for the circulating water.

**MP1 / MP2 PS 2P STD: Accumulation pre-engineered for the primary and secondary circuit :** The sole function of the pump is to circulate the water around the primary circuit: this circuit includes the accumulation tank and plate exchanger (chiller water circuit). The installer must mount the pumping section relative to the secondary circuit formed by the accumulation tank (with the pre-engineered wet connections) and the system served. No high working head version available.

**MP1 / MP2 SS 2P STD: Hydronic Kit without Water Storage Tank (Standard)<sup>(A)</sup>.** The pump draws water from the system, sends it to the plate heat exchanger and returns it to the system. During normal operating conditions, the pump in this configurations can provide a residue head from 86 to 150 kPa (from 9 to 15 m w.c.).

**MP1 / MP2 SS 2P HP1: Hydronic Kit without Water Storage Tank (High Working Head)<sup>(B)</sup>.** The pump draws water from the system, sends it to the plate heat exchanger and returns it to the system. During normal operating conditions, the pump in this configurations can provide a residue head from 198 to 255 kPa (from 20 to 25 m w.c.).

**MP1M AM 2P STD: Accumulation on the Plant Delivery side (Standard)<sup>(A)</sup>:** The pump draws water from the system, sends it to the plate exchanger and from thence to the inertial accumulation tank. During normal operating conditions, the pump in this configuration is able to provide a residue head from 86 to 150 kPa (from 9 to 15 m.w.c.) for the circulating water. The **Inverter** control enables the calibration of the plant water flow directly from the control panel permitting: energy savings compared to a traditional setting, reduction of water hammer in the pipes thanks to gradual start-ups and shutdowns, noise reduction of the pump, reducing starting current and improved thermal protection against overload.

**MP1M AM 2P HP1: Accumulation on the Plant Delivery side (High)<sup>(B)</sup>:** The pump draws water from the system, sends it to the plate exchanger and from thence to the inertial accumulation tank. During normal operating conditions, the pump in this configuration is able to provide a residue head from 198 to 255 kPa (from 20 to 25 m.w.c.) for the circulating water. The **Inverter** control enables the calibration of the plant water flow directly from the control panel permitting: energy savings compared to a traditional setting, reduction of water hammer in the pipes thanks to gradual start-ups and shutdowns, noise reduction of the pump, reducing starting current and improved thermal protection against overload.

**MP1M SS 2P STD: Hydronic Kit without Water Storage Tank (Standard)<sup>(A)</sup>.** The pump draws water from the system, sends it to the plate heat exchanger and returns it to the system. During normal operating conditions, the pump in this configurations can provide a residue head from 86 to 150 kPa (from 9 to 15 m w.c.). The **Inverter** control enables the calibration of the plant water flow directly from the control panel permitting: energy savings compared to a traditional setting, reduction of water hammer in the pipes thanks to gradual start-ups and shutdowns, noise reduction of the pump, reducing starting current and improved thermal protection against overload.

**MP1M SS 2P HP1: Hydronic Kit without Water Storage Tank (High Working Head)<sup>(B)</sup>.** The pump draws water from the system, sends it to the plate heat exchanger and returns it to the system. During normal operating conditions, the pump in this configurations can provide a residue head from 198 to 255 kPa (from 20 to 25 m w.c.). The **Inverter** control enables the calibration of the plant water flow directly from the control panel permitting: energy savings compared to a traditional setting, reduction of water hammer in the pipes thanks to gradual start-ups and shutdowns, noise reduction of the pump, reducing starting current and improved thermal protection against overload.

**(A):** For the working head values depending on the water flow rate, consult the Standard Working Head MP-AM graph.

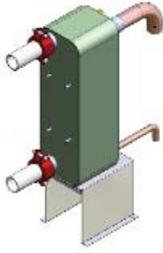

**(B):** For the working head values depending on the water flow rate, consult the High Working Head MP-AM graph.

**NOTE: (M):** Installed      **(F):** To be installed by customers

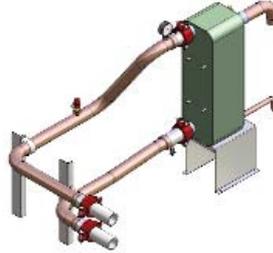

**NOTE: It is essential to purchase the units with either the KT or MP accessory described previously. The choice of one automatically excludes the other.**

## ACCESSORIES AND OPTIONAL EQUIPMENT

**CR - Remote control (F).** This can be used to select all the monitoring and display functions of the control unit on the machine at a maximum distance of 100 meters away. It must be installed by using a cable with three strands or three wires in **PVC** of the **N07-VK** type with a 1mm<sup>2</sup> section. The transmission line must be installed in a race-way separate from any electric powering wires (**230/400 V**).

The control unit has the following buttons:

**MODE key** : used to select the operating mode

**ON/OFF key** : used to turn the unit ON/OFF and to reset the alarms

**Mode + ON/OFF keys** : used to access and quit the various menu levels

**UP key**: scrolls forwards through the menu items or increases the value of a parameter

**Tasto DOWN**: scrolls backwards through the menu items or decreases the value of a parameter.

**KOP - Programmer clock (F).** Allows the unit to be turned on and off depending on the programmed time setting (up to 14 switching actions can be programmed as required throughout the 7 days of the week).

**RAG: Antifreeze heating element for the accumulation tank (M/F).** Plug type. This activates in parallel with the evaporator's antifreeze heating element and keeps the water at a temperature able to prevent ice from forming when the unit remains idle during the winter.

**TAT- High Temperature Thermostat (M).** Two thermostats in series on compressors outlet pipes preserve operation not allowing temperature to rise up than a specified non adjustable value.

**SND- External Air Probe (M).** External air probe mounted near coil allows smart defrosting, climatic variation of setpoint and enables heat pump stop reducing the external air temperature below a setpoint.

**INT - Serial interface (F).** Allows serial communication on RS485 by MODBUS protocol

**FLS - Flow switch (F).** Paddle flow switch on the water circuit to avoid the risk of freezing if the water flow is shut off for some reason.

**SS - Soft Starter (M).** Soft starter for compressor, reduce the maximum starting current up to 60% of nominal starting current.

**RIF - Capacitors for power factor corrections (M).** Capacitors for power factor corrections increase power factor  $\cos \varphi$  ( $>0.91$ ) and reduce power input.

**MTC - Magnetothermic switch (M).** Magnetothermic switch on all loads place of fuses.

**CSF - Voltage monitor and sequence meter (M).** The device enables control of the correct sequence of power phases and the lack of any phases. It also ensures that the unit works within  $\pm 10\%$  the rated voltage (MIN=360 V - RATED=400V - MAX=440V). It blocks the unit if the voltage is outside the limits provided for.

**NOTE: (M):** Installed      **(F):** To be installed by customers

---

### Mechanical options

---

#### Special finned heat exchangers

- Coils with copper fins
- Coils with tin-coated copper fins
- Coils with aluminium fins with acrylic, epoxy or hydrophilic coating.

**Tw**= Outlet water temperature °C

**kWf** = refrigerating power (kW).

**kWa** = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ kW}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Outlet water temperature °C

kWf = refrigerating power (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Temperatura acqua in uscita in °C

kWf = Potenza frigorifera netta(kW).

kWa = Potenza assorbita dai compressori (kW)

Le prestazioni standard si riferiscono ad un differenza di 5 °C di temperatura tra acqua entrante ed uscente dallo scambiatore a piastre, e al funzionamento dell'unità con tutti i ventilatori alla massima velocità. Si considera inoltre un fattore di sporramento di  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  e l'unità posta a zero metri sul livello del mare (Pb = 1013mbar).

Tw= Temperatura acqua in uscita in °C

kWf = Potenza frigorifera netta(kW).

kWa = Potenza assorbita dai compressori (kW)

Le prestazioni standard si riferiscono ad un differenza di 5 °C di temperatura tra acqua entrante ed uscente dallo scambiatore a piastre, e al funzionamento dell'unità con tutti i ventilatori alla massima velocità. Si considera inoltre un fattore di sporcamento di  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  e l'unità posta a zero metri sul livello del mare (Pb = 1013mbar).

**Tw**= Temperatura acqua in uscita in °C

**kWf** = Potenza frigorifera netta(kW).

**kWa** = Potenza assorbita dai compressori (kW)

Le prestazioni standard si riferiscono ad un differenza di 5 °C di temperatura tra acqua entrante ed uscente dallo scambiatore a piastre, e al funzionamento dell'unità con tutti i ventilatori alla massima velocità. Si considera inoltre un fattore di sporcamento di  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  e l'unità posta a zero metri sul livello del mare (Pb = 1013mbar).

TWE= Evaporator outlet water temperature °C

TWR: Recovery outlet water temperature (°C)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4}$  m<sup>2</sup> K/W fouling factor has also been considered with the unit installed at zero meters above sea level (P<sub>b</sub> = 1013mbar).

**Tw**= Outlet water temperature in °C

**kWf** = refrigerating power (kW).

**kWa** = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all the fans to top speed. A  $0.44 \times 10^{-4} \text{ m}^2/\text{KW}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Outlet water temperature in °C

kWf = refrigerating power (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all the fans to top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Outlet water temperature in °C

kWt = heating output (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger, outdoor air with 87% relative humidity and to operation of the unit with all the fans to top speed. A 0.44 x 10<sup>-4</sup> m<sup>2</sup> K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**NOTE**

For air temperatures of less than 7°C, the heating capacity is declared without considering the effect of the defrosting, strictly correlated with the humidity in the outdoor air.

Tw= Outlet water temperature in °C

kWf = refrigerating power (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all the fans to top speed. A  $0.44 \times 10^{-4} \text{ m}^2/\text{KW}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Outlet water temperature in °C

kWt = heating output (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger, outdoor air with 87% relative humidity and to operation of the unit with all the fans to top speed. A 0.44 x 10-4 m2 K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**NOTE**

For air temperatures of less than 7°C, the heating capacity is declared without considering the effect of the defrosting, strictly correlated with the humidity in the outdoor air.

Tw= Outlet water temperature in °C

kWf = refrigerating power (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger and to operation of the unit with all the fans to top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ kW}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

Tw= Outlet water temperature in °C

kWt = heating output (kW).

kWa = Power input of compressors (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the plate-type heat exchanger, outdoor air with 87% relative humidity and to operation of the unit with all the fans to top speed. A 0.44 x 10-4 m2 K/W fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**NOTE**

For air temperatures of less than 7°C, the heating capacity is declared without considering the effect of the defrosting, strictly correlated with the humidity in the outdoor air.

A calculation example showing how the table is used is given below.

Consider unit **IR 160.2** in the Basic Version with air temperature: in 35°C d.b. and water temperature out 7°C:

- Cooling capacity of the Basic Version unit (VB):  $Pf_{VB} = 158 \text{ kW}$
- Power input of the Compressors in the Basic Version unit (VB):  $Pass_{CP,VB} = 53.2 \text{ kW}$
- Water Flow Rate of the Basic Version unit (VB):  $Q_{VB} = 7.55 \text{ l/s}$
- Water pressure drop of the Basic Version unit (VB):  $\Delta p_{VB} = 39 \text{ kPa}$
- **with 30% brine and -2°C temperature of the water produced**

The corresponding values for the Brine Unit are:

- Cooling capacity  $Pf_{BR/BP} = Pf_{VB} \times (0.725) = 115 \text{ kW}$
- Compressor power input  $Pass_{CP,BR/BP} = Pass_{CP,VB} \times (0.92) = 48.9 \text{ kW}$
- Water flow rate  $Q_{BR/BP} = Q_{VB} \times (0.78) = 5.89 \text{ l/s}$
- Water pressure drop  $\Delta p_{BR/BP} = \Delta p_{VB} \times (1.155) = 32 \text{ kPa}$

If you need to calculate the performances of the unit with outdoor air temp. different than 35°C, you have to use the values for  $Pf_{VB}$  and  $Pass_{CP,VB}$  reported on the tables standard performances for the requisited air temp. and with water leaving temp=7°C.

With  $Pf_{VB}$  calculate  $Q_{VB}$  and using the graph water pressure drop Basic Version you have  $\Delta p_{VB}$ . Then apply the corrective coefficients indicated on the tables for BR-BP.

**In case of other type of antifreezing fluid please contact our sales office.**

## NOISE LEVELS

The noise levels refer to units operating in the nominal conditions (water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C), due to a change of external air temperature noise levels may change to ensure proper functioning of the unit within operating range.

The acoustic pressure levels are calculated 1/ 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

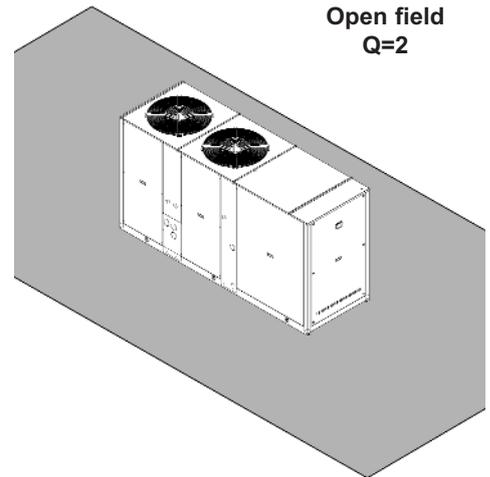

**SWL** = Sound power levels, with reference to  $1 \times 10^{-12}$  W.

The **Total** sound power level in **dB(A)** measured in compliance with **ISO 9614** standards, is certified according to the **Eurovent** certification program and it is the only mandatory value (the values of octave band in the table are indicative).

Eurovent certification (**E**) exclusively refers to the **Total** Sound Power in **dB(A)**, which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL** = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.

The sound pressure levels are values calculated by applying the **ISO-3744 relation (Eurovent 8/1)** and refer to a distance of 1 meter away from the external surface of units operating in the open field with directivity factor 2 (Q=2) and the units operating in nominal conditions in the cooling mode.

(E): data declared according to **LCP EUROVENT** certification program. The values are for units without options and accessories.

# OPERATING RANGE

## Operating range

The graphs below give the operating ranges within which correct operation of the units is guaranteed. The use of the units in conditions differing from those indicated will void the warranty with which the product is supplied. In the following table, there are the thermal water head limit values of the unit.

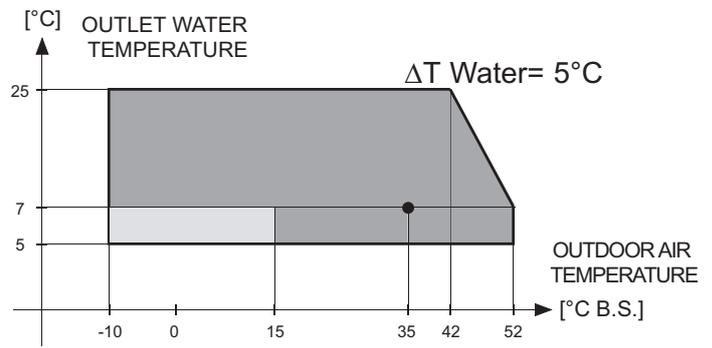

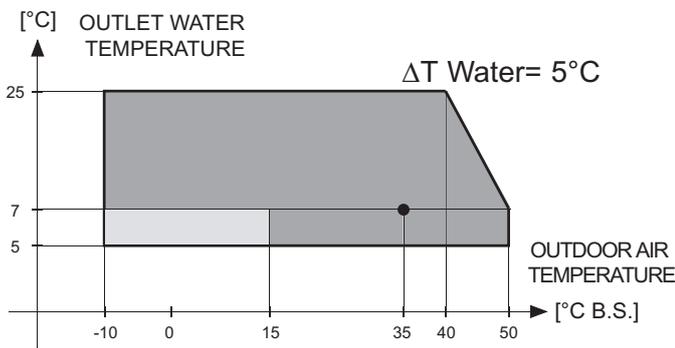

Thermal Water Head		Limit value
Minimum	°C	3
Maximum	°C	8

**Note: Make sure the water flow is within the minimum and maximum pressure drop as reported "water pressure drop plate heat exchanger".**

## COOLING MODE

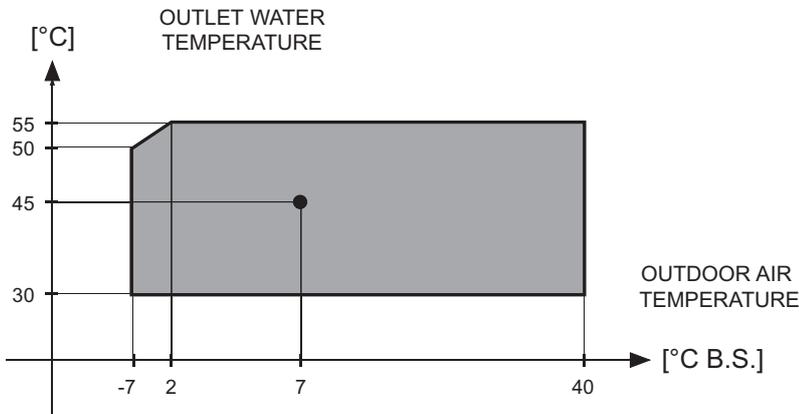

**Medium Temperature 0M5**

**High Temperature 0A5**

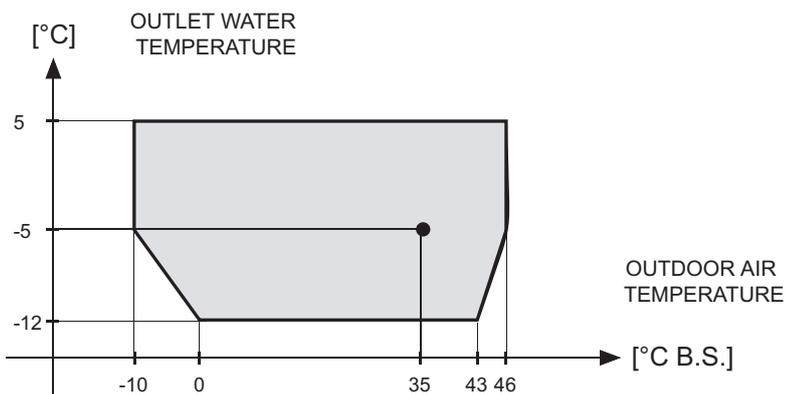

In these applications, it's advisable to use brine.

## HEATING MODE

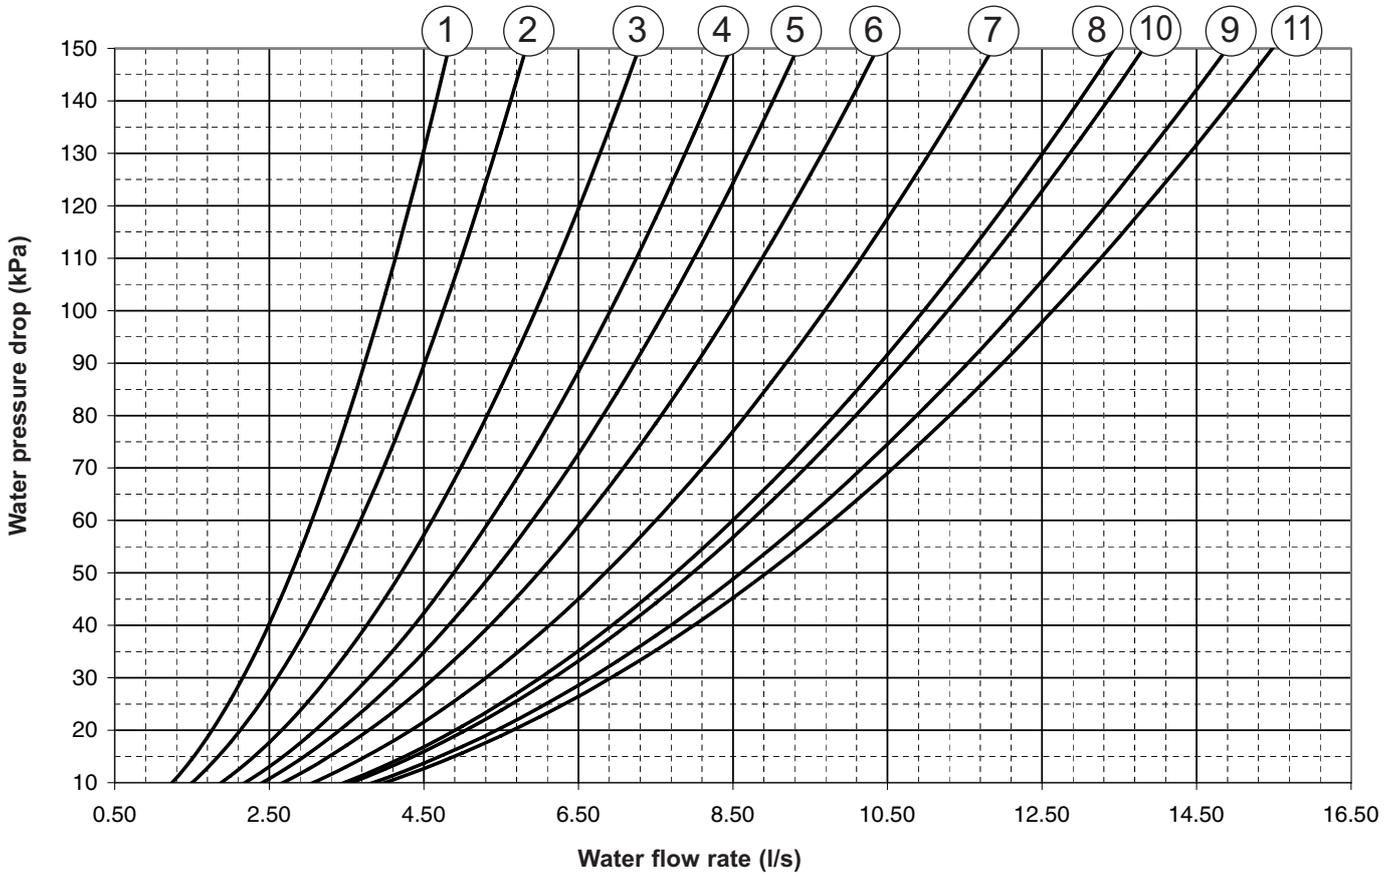

## COOLING MODE Brine Unit (BR - BP)

Use water glicol as specified in the paragraph "Specification data for Brine Unit BR - BP".

## WATER PRESSURE DROP PLATE HEAT EXCHANGER

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**. The operating range is delimited by the minimum and maximum values given in the next table.

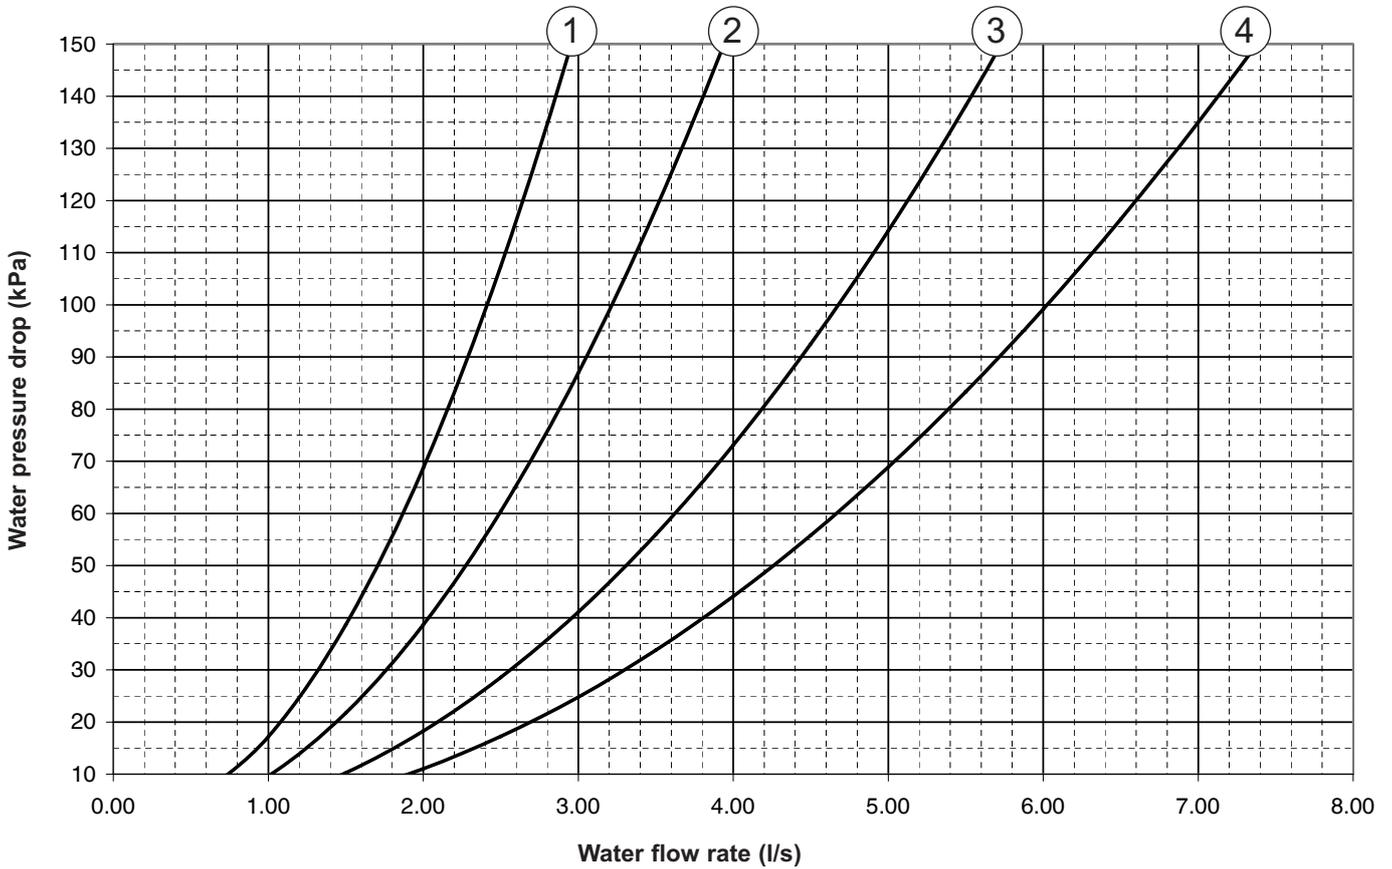

### Operation range

Unit Size		50	60	70	80	90	100	115	130	145	160	180	200	UM	NOTES

## WATER PRESSURE DROP OF THE DESUPERHEATER VD

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**, for the Special Versions with Desuperheater (VD) in both the units that operate in the Cooling mode only (IR) and in Heat Pump units (IP). The operating range is delimited by the minimum and maximum values given in the next table.

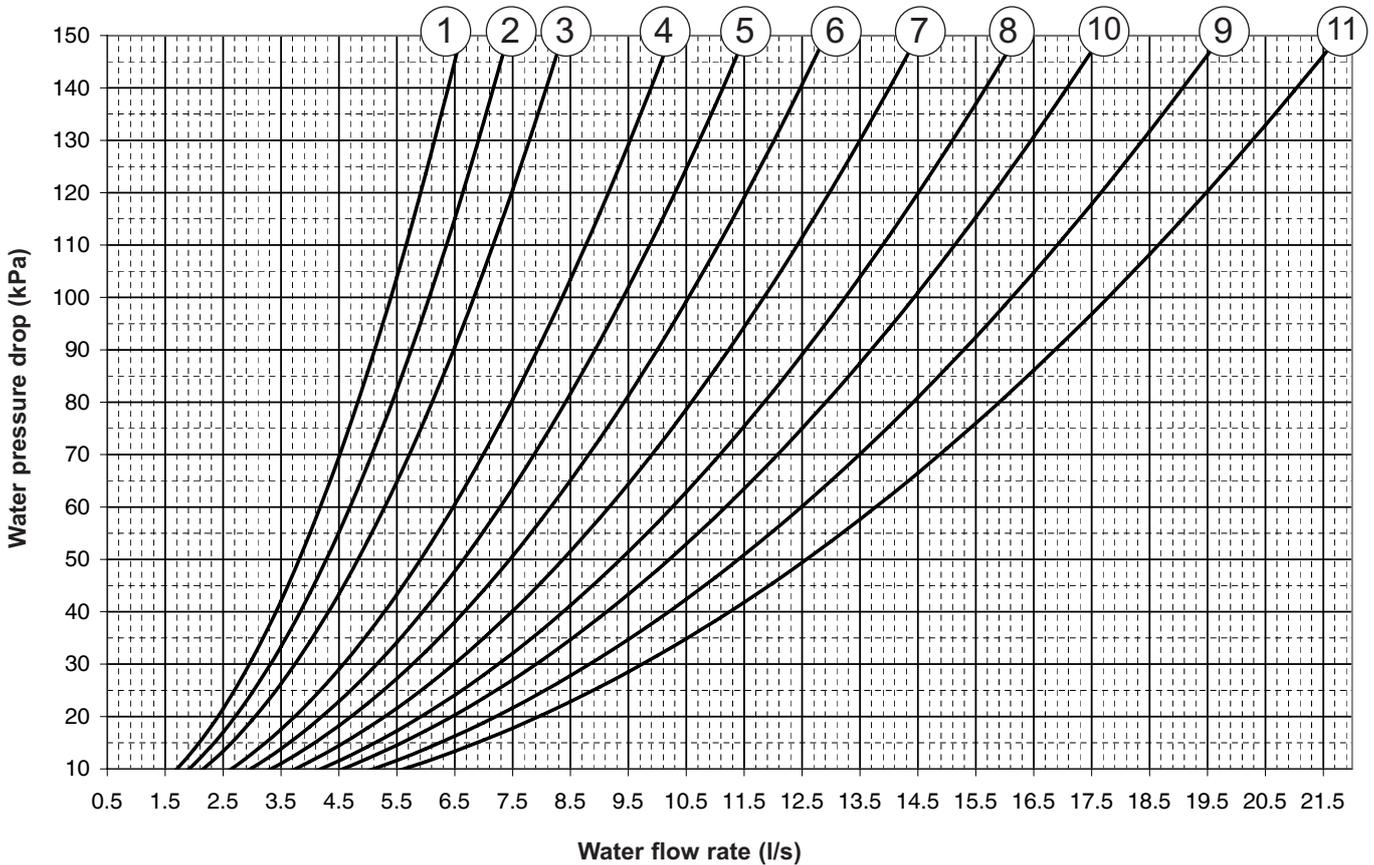

### Operation range

Max. operating pressure on wet side		600											kPa		

## WATER PRESSURE DROP TOTAL HEAT RECOVERY VR

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**, for the Special Versions with Total heat recovery (VD) in both the units that operate in the Cooling mode only (IR). The operating range is delimited by the minimum and maximum values given in the next table.

### Operation range

 water temperature: recovery inlet 40°C - recovery outlet 45°C

## WORKING HEAD OF THE HYDRONIC KIT MP AM STD, MP SS STD AND MPM AM STD

The following graph gives the head values (**kPa**) depending on the water flow rate (**liters/second**). The operating range is delimited by the minimum and maximum values given in the next table.

Working head is the one on the wet module outlet minus all the water pressure drop of the unit.

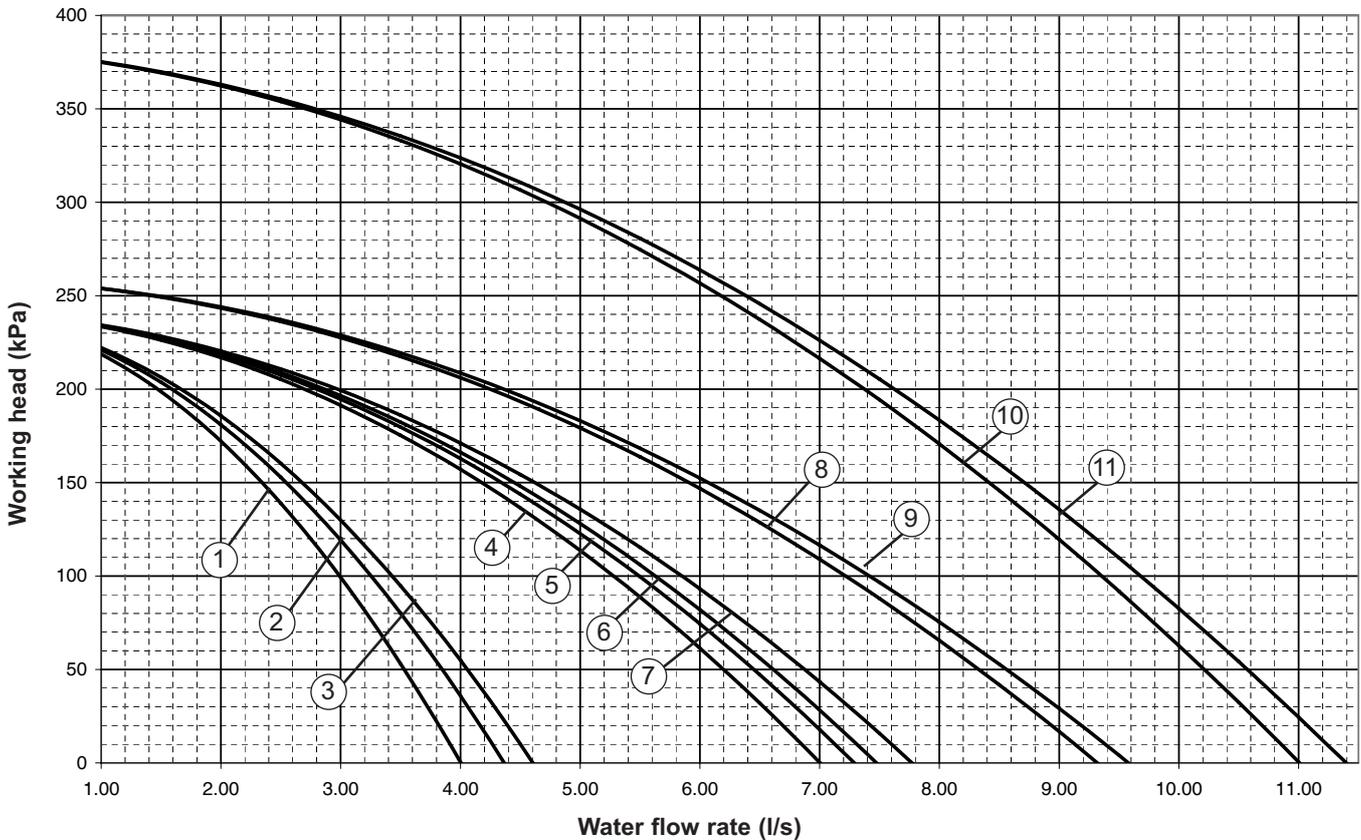

For hydronic kit with **inverter pump (MPM)** the graphic is at the maximum pump speed, for lower speed values curve decreases according to the following formulas:

$$Q_2 = Q_1 * \frac{n_2}{n_1} \quad n: \text{ pump speed [Hz]}$$

$$H_2 = H_1 * \frac{n_2^2}{n_1^2} \quad Q: \text{ water flow [l/s]} \quad H: \text{ working head [kPa]}$$

$$P_2 = P_1 * \frac{n_2^3}{n_1^3} \quad P: \text{ power input [kW]}$$

$$n_1 = 100\% \\ 30\% \leq n_2 \leq 100\%$$

### Operation range

Max. operating pressure on wet side	600												kPa		

## MAXIMUM VOLUME OF WATER

### Maximum volume of water in the system with wet module

Before filling the water system, it is advisable to consider the type of installation in question, i.e. check the difference in level between the wet module and user. The following table gives the maximum water content of the water supply system in liters, depending on the capacity of the standard surge chamber supplied and the pressure at which it should be charged. The surge chamber setting must be regulated to suit the maximum positive difference in level of the user.

**Maximum setting value 600 kPa.**

With a positive H of more than 12.25 meters, calculate the surge chamber's service charge value in kPa using the formula below:

$$\text{Surge chamber service charge} = [H/10.2 + 0.3] \times 100 = [\text{kPa}]$$

**NOTE:** In case A, make sure that the user's lowest point is able to withstand the global pressure.

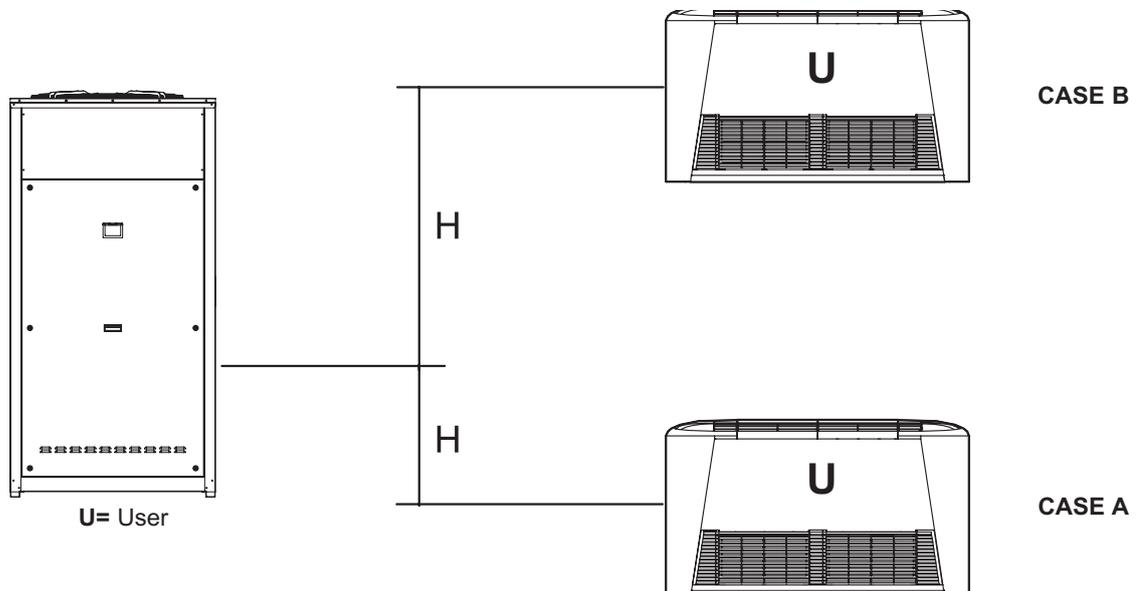

Tab.1

Model		50-60-70-80	90-100-110-115-130-145-160-180-200			
Surge chamber volume (liters)		12	24			
Thermal expansion of water (10-40°C)		0.0074				
Thermal expansion of water (10-60°C)		0.0167				
H (meters)		Surge chamber pressure (kPa)	Maximum total volume of water supply system (liters)			
			IR	IP	IR	IP
<b>Case A</b>	H < 0	150 (standard)	1043	461	2085	921
	0 < H < 12.25	150 (standard)	1043	461	2085	921
<b>Case B</b>	15	177	980	435	1960	870
	20	226	866	384	1732	768
	25	275	753	334	1505	667
	30	324	640	283	1279	566

**NOTE:** If the unit operates with brine, calculate the real volume of the system by taking into account the corrective factors for the volume of the system given in the table below.

### Corrective factors per total maximum volume of the system with brine

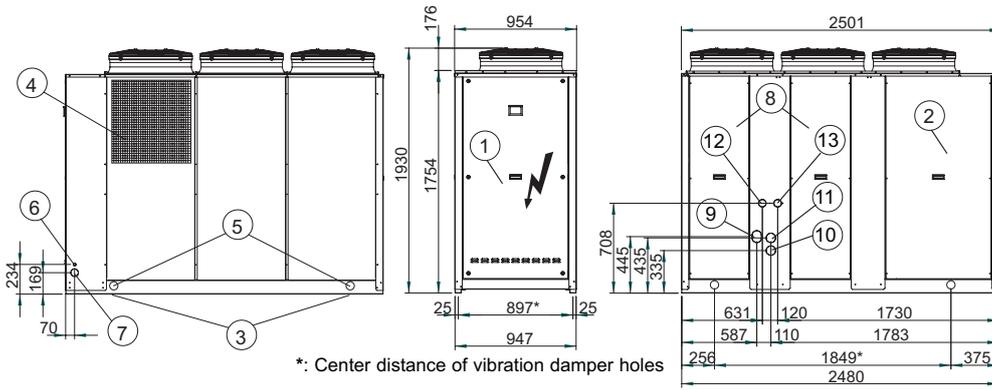

% of brine	0%	10%	20%	30%	40%
<b>Cooling Mode</b>	1.000	0.738	0.693	0.652	0.615
<b>Heating Mode</b>	1.000	0.855	0.811	0.769	0.731

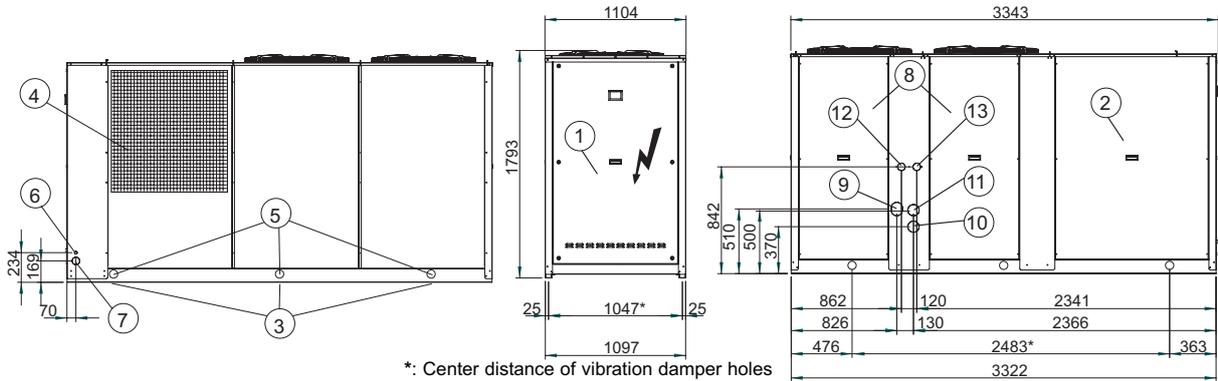

# DIMENSIONAL DATA

## Overall dimensions

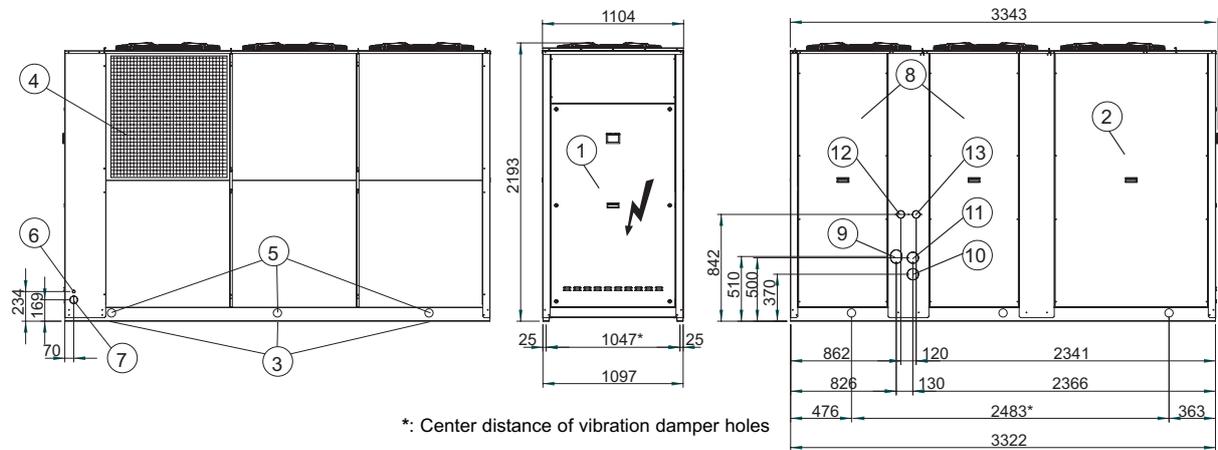

**Mod. 50-60-70-80**

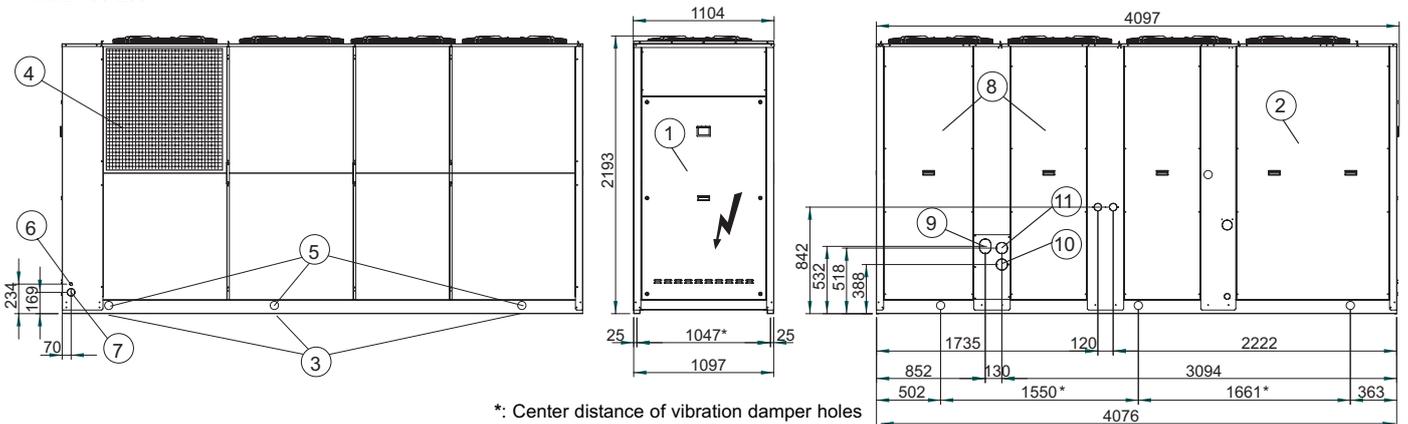

**Mod. 90-100**

**Mod. 115-130-145-160**

**Mod. 180-200**

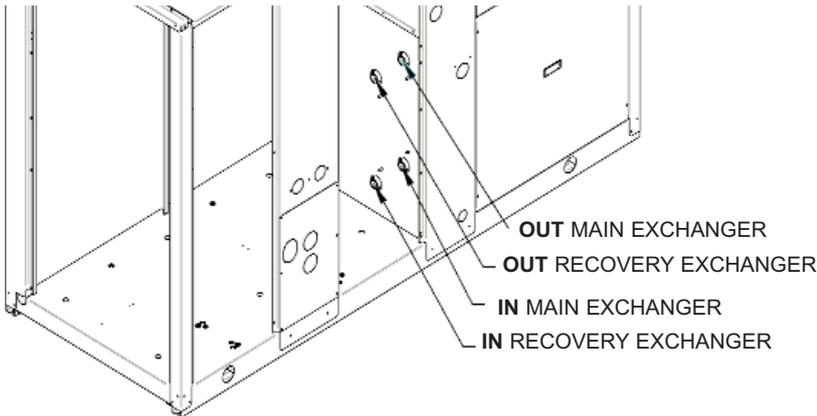

## DIMENSIONAL DATA

### Description of the components

- 1 - Access panel to electric panel's power section
- 2 - Access panel to compressor compartment
- 3 - Vibration damper fixing holes (4 pcs)
- 4 - Coil protection grilles (accessory)
- 5 -  $\varnothing$  65 mm lifting holes
- 6 -  $\varnothing$  22 mm input hole for accessory cables
- 7 -  $\varnothing$  60 mm hole for electric power supply input
- 8 - Access panel to pump compartment
- 9 - Water inlet for MP AM STD and MP SS STD

- 10 - Water inlet for KT and MP PS STD
- 11 - Water outlet
- 12 - Water inlet for Desuperheater (only VD-VR version)
- 13 - Water outlet for Desuperheater (only VD-VR version)

**Note (1): Victaulic connections Kit do not allow external connections.**

### Minimum space required for operation

To correctly install the unit, comply with the measurements for the free area that must be left around the machine, as shown in the figure.

This will ensure good air circulation, allow the unit to operate correctly and facilitate future maintenance work.

The distances must be doubled if the unit is to be installed in a pit.

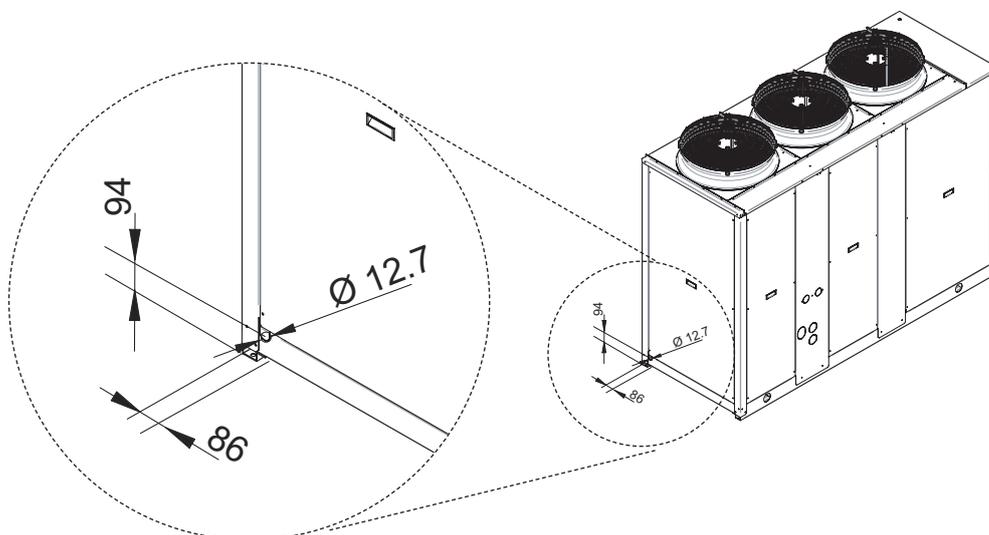

**NOTE. Allow for an uncluttered area of not less than 2.5 meters above the unit.**

Modello	50-80	90-100	115-200
E [mm]	1600		2000

### Position of condensate drain

The condensate tray (if present) must have a suitable drain trap to prevent spilling of water during operation.
